Cybersecurity: build resilience into the design

Équipe Deliwrapp · 2026-10-13

Security works better when teams treat it as a product quality from the first decisions.

Start with real scenarios

Which services must remain available? Which data would cause the greatest impact if lost or exposed? These questions focus effort on meaningful risks.

Reduce exposure

Fewer privileges, dependencies and stored data reduce the attack surface. Tested backups, useful logging and simple procedures strengthen response capability.

Prepare recovery

Resilience means accepting that incidents can happen. A team that knows its responsibilities, contacts and sequence of actions returns to a controlled situation faster.
