Useful AI: moving from prototype to controlled use

Équipe Deliwrapp · 2026-10-20

An impressive prototype is not enough: sustainable AI use needs measurable goals, controlled data and human oversight.

Define the service delivered

Before choosing a model, describe the decision or task AI should improve. A precise target lets the team compare results with the existing method and identify cases where the tool should not act.

Evaluate beyond the demo

Quality, cost, response time, privacy and explainability belong in the same assessment. A realistic test set exposes subtle errors hidden by a prepared demonstration.

Keep human accountability

Escalation rules, traceability and correction paths are essential. The aim is to improve work without dissolving responsibility.
